- ALL(17)
- CORRECT(9)
- INCORRECT(8)
- SKIPPED(0)

Q. 1

Which of the following algorithm is best suitable for sorting of linked list?

[Solution Video](#) | [Have any Doubt ?](#) | 

A
Quick sort

B
Merge sort

Your answer is **Correct**

Solution :
(b)
Merge sort time complexity is $\theta(n \log n)$ for sorting of linked list.

C
Heap sort

D
None of the above

QUESTION ANALYTICS

Q. 2

Consider the following statements about linked list and array?

- S₁ : Random access is not allowed in implementation of linked list.
S₂ : Insertion and deletion of elements in easy in linked list than array.
S₃ : Array has better cache locality than linked list which make array preferable in terms of performance.

Which of the following is true?

[Solution Video](#) | [Have any Doubt ?](#) | 

A
S₁ and S₂ only

B
S₁ and S₃ only

C
S₂ and S₃ only

D
All of the above

Your answer is **Correct**

Solution :
(d)
• Random access is not allowed in linked list but allowed in array.
• Insertion and deletion in array is difficult, since we need to shifts other elements, while insertion and deletion in linked list in easy (only few pointers need to be charged in worst case both take O(n) time).
• Since array are contiguous memory blocks, so large chunk of them will be loaded into the cache upon

QUESTION ANALYTICS
Q. 3

Which of the following represents the final AVL tree if 8, 1, 9, 3, 2, 6, 5, 4, 7 elements are inserted into an empty tree?

[Solution Video](#) | [Have any Doubt ?](#)
A

B

C

 Your answer is **Correct**
Solution :

(c)

8, 1, 9, 3, 2, 6, 5, 4, 7

∴ Option (c) is correct.

D

None of these

QUESTION ANALYTICS

Q. 4

Consider the following code fragment where head of the 2 sorted linked list is passed as an argument:

```
struct node * fun (struct node * x, struct node * y) {  
    struct node * z = NULL;  
    if (x == NULL) return (y);  
    else if (y == NULL) return (x);  
    if (x → data <= y → data) {  
        z = x;  
        z → next = fun (x → next, y);  
    }  
    else  
    {  
        z = y;  
        z → next = fun (x, y → next);  
    }  
    return(z);  
}
```

Which of the following is correct about fun ()?

[Solution Video](#) | [Have any Doubt ?](#)

A

Returns the list which concatenates the given two lists

B

Returns the smallest list of given two lists

C

Returns the sorted list of given two lists

Your answer is Correct**Solution :**

(c)

It merges the two sorted lists.

In every recursion, z gets a node which is smallest node from **x and y**.∴ Finally z gets entire sorted list of given two sorted lists of **x and y**.

So option (c) is correct.

D

None of these

A

Largest node in the left subtree

 Your answer is **Correct**
Solution :

(a)

When we delete any node in Binary Search Tree then it is either replaced by inorder successor (smallest in right subtree) or inorder predecessor (largest in left subtree). So, elements will be largest element in subtree.

When 10 is deleted then it is either replaced by 9 or 15 i.e. largest in left subtree or smallest in right subtree.

B

Smallest node in the subtree

C

Root of the left subtree

D

Any one from (a) and (c)

QUESTION ANALYTICS

Q. 6

Consider a binary tree where for every node $|P - Q| \leq 2$. P represents number of nodes in left sub tree for node S and Q represents the number of nodes in right sub tree for node S for $h > 0$. The minimum number of nodes present in such binary tree of height $h = 4$ _____. (Assume root is at height 0)

[FAQ](#) | [Solution Video](#) | [Have any Doubt ?](#)

9

Correct Option

Solution :

9

For height ($h = 1$) minimum number of node is 2 by using formula $2^{h-1} + 1$ i.e.

For height ($h = 2$) minimum number of node is 3 by using formula $2^{h-1} + 1$ i.e.

For height ($h = 3$) minimum number of node is 5 by using formula $2^{h-1} + 1$ i.e.

So for height ($h = 4$) minimum number of node will be 9 by using formula $2^{h-1} + 1$.

Your Answer is 7

QUESTION ANALYTICS

Q.7

Consider the following C-programming run over given binary tree by passing root node as parameter:

```
int count (struct * node * node) {
    if (node == NULL)
        return 0;
    int old_val = node → data;
    node → data = count (node → left) + count (node → right);
    return node → data + old value;
}
```

The final value return by count () function is _____.

[▶ Solution Video](#) | [Have any Doubt ?](#)

57

Your answer is **Correct**57

Solution :

57

The given code calculate node data \rightarrow sum of left subtree + sum of right subtree for each node.

10

Correct Option

Solution :

10

Since number of function calls simultaneously present in stack is '5'.

Since maximum edges asked, so, it must be complete graph i.e.

$$\frac{5 \times (5-1)}{2} = \frac{20}{2} = 10$$

So, 10 edges are present in such graph.

Your Answer is 4

QUESTION ANALYTICS

Q. 9

Consider the following graph:

The number of topological orders for the given graph are _____.

9

Correct Option

Solution :

9

Your Answer is 4

QUESTION ANALYTICS

Q. 10

Consider the following statements:
S₁ : Rotation operation in AVL always preserves the inorder numbering.
S₂ : The median of all element in the AVL trees is always at root or one of its two children.
S₃ : If every node in binary search tree has either 0 or 2 child, then searching time is O(logn).
S₄ : A 3-array tree is a tree in which every internal node has exactly 3 children. The number of leaf nodes in such a tree with 20 internal will be 41.
Which of above statements are true?

[FAQ](#) | [Solution Video](#) | [Have any Doubt ?](#) |

A
S₁, S₂ only

B
S₂, S₃ only

C
S₃, S₄ only

D
S₁, S₄ only

Your answer is **Correct**

Solution :
(d)
• Rotation operation in always preserves the inorder numbering so 1st is true.
• AVL tree doesnot guarantee that both left and right subtree has equal number of nodes, so statement is false.
• Consider

satisfying the property of statement 3, in this tree if element present is at last level the complexity will be $c \times n/2 \simeq O(n)$. So S₃ is false.

- Total nodes = 3 × internal nodes + 1
= 3 × 20 + 1 = 61

and 20 + 41 = 61
(Leaf + internal = total) so S₄ is true.

QUESTION ANALYTICS

Q. 11

Consider the following function with a Binary Tree with atleast one node:
int path (struct node * x, int len

```
{  
    if (x == NULL) return (B);  
    else return (A);  
}
```

Assume the above function is used to check the given binary tree has depth with specified length from

A

A is $\text{path}(x \rightarrow \text{left}, \text{len}-1) \parallel \text{path}(x \rightarrow \text{right}, \text{len}-1)$, B is $(\text{len} == 0)$

Your answer is **Wrong**

B

A is $\text{path}(x \rightarrow \text{left}, \text{len}-1) \parallel \text{path}(x \rightarrow \text{right}, \text{len}-1)$, B is $(\text{len} == 1)$

C

A is $\text{path}(x \rightarrow \text{left}, \text{len}-1) \parallel \text{path}(x \rightarrow \text{right}, \text{len}-1)$, B is $(\text{len} == -1)$

Correct Option

Solution :

(c)

Given function call is recursive.

Before calling any recursive call, it decrements length. So at leaf node recursive call will decrement by 1 even there exist no path.

\therefore B is $(\text{len} == -1)$

Before traversing its child it decrements the length, whenever a length reaches to -1 and node is leaf then it implies there exist a path with given length.

\therefore A is $\text{path}(x \rightarrow \text{left}, \text{len} - 1) \parallel \text{path}(x \rightarrow \text{right}, \text{len} - 1)$

If one of the path returns non-zero then it recursively returns back. So option (c) is correct.

D

A is $\text{path}(x \rightarrow \text{left}, \text{len}) \parallel \text{path}(x \rightarrow \text{right}, \text{len})$, B is $(\text{len} == 1)$

QUESTION ANALYTICS

Q. 12

Which of the following is true?

FAQ | Solution Video | Have any Doubt ?

A

In breadth first search of an undirected graph there are no back edge and no forward edge.

Correct Option

Solution :

(a)

Since for undirected graph, breadth first search does not have back edge and forward edge but for directed graph we have back edge.

Ex: Consider Random Graph (Directed):

BFS of graph: Assume (A) is start node

Here in graph no forward edge present, but $E \rightarrow A$ back edge present, so (b) is false. Since undirected graph for BFS does not create back edge so statement is false.

B

In breadth first search of an directed graph there are no back edge and no forward edge.

D

Both (b) and (c)

Your answer is **Wrong**

QUESTION ANALYTICS

Q. 13

Consider the following:

Which of the following represent Inorder and Postorder of the tree?

Have any Doubt ?

A

Inorder: ABKJCLIEDHFG

Postorder: ABCJKIDIEFGHL

B

Inorder: AKBJCILDEFHG

Postorder: ABCJKIDIEFGHL

Your answer is **Wrong**

C

Inorder: AKBJCLIDEHFG

Postorder: ABCJKIDIEFGHL

Correct Option

Solution :

(c)

• Inorder of tree is: Left, Root, Right (any other)

So, Inorder: AKBJCLIDEHFG

• Postorder of tree is Left, Right (any other), Root

So, Post order is: ABCJKIDIEFGHL

D

Inorder: ABCJKILDEHFG

Postorder: ABCJKLIEDHFG

[Solution Video](#) | [Have any Doubt ?](#)

A

$$d(i-1) + 1$$

B

$$d(i-1) + j + 1$$

 Your answer is **Correct**
Solution :

(b)

Consider 3 array heap:

Array = A

1	2	3	4	5	6	7	
1	2	3	4	5	6	7	n

 So, root at at A[1] i.e. $d(i-1) + j + 1$

$$= 3(1-1) + j + 1$$

$$= 0 + 0 + 1 = 1$$

$$\text{1st child of root} = d(i-1) + j + 1$$

$$= 3(1-1) + 1 + 1 = 2$$

$$\text{3rd child of root} = d(i-1) + j + 1$$

$$= 3(1-1) + 3 + 1$$

$$= 0 + 4 = 4$$

$$\text{Index for node 7} = d(i-1) + j + 1$$

$$= 3(2-1) + 3 + 1$$

$$= 3 + 3 + 1 = 7$$

 So, index maps to $d(i-1) + j + 1$.

C

$$d(i-1) + j$$

D

$$(d \times i) + j + 1$$

QUESTION ANALYTICS

Q. 15

A 3-array tree is a tree in which every internal node has exactly 3 children. The number of leaf nodes in such a tree with 20 internal nodes will be _____.

[Solution Video](#) | [Have any Doubt ?](#)

41

 Your answer is **Correct**41

Solution :

41

 $n \rightarrow$ number of internal nodes:

 Let $n = 1$

$$\Rightarrow 3 \Rightarrow 2(1-1) + 3$$

Ashima Garg

Course: GATE

 Let $n = 3$

$$\Rightarrow 7 \Rightarrow 2(3-1) + 3$$

 Number of internal nodes = $2(n-1) + 3 = 2(20-1) + 3 = 41$

For every internal node except root node, 2 leaf nodes are added.

QUESTION ANALYTICS

Q. 16

 Consider a binary min heap given below containing integer in $[1, 15]$. The maximum number of node movement on 5 successive removal of element are _____.

[Solution Video](#) | [Have any Doubt ?](#)

18

Correct Option

Solution :

18

First deletion takes 4 node movement

Second deletion takes 4 node movement

Third deletion takes 3 node movement

Fourth deletion takes 4 node movement

Fifth deletion takes 3 node movement

 Total number of head movement = $4 + 4 + 3 + 4 + 3 = 18$
