 $384\sqrt{3}$  sq. units

D

 $768\sqrt{3}$  sq. units

Your answer is Correct

Solution:

(d)

When we drop an altitude in an equilateral triangle we create two 30 - 60 - 90 right triangle

which the altitude is opposite the 60 degree angle; thus, the altitude =  $side \frac{\sqrt{3}}{2}$ , thus:

$$side \frac{\sqrt{3}}{2} = 48$$
$$side = \frac{96}{\sqrt{3}}$$

We may recall that the area formula for an equilateral triangle is  $\frac{(\text{side}^2\sqrt{3})}{4}$ , thus:

Area = 
$$\frac{\left[ \left( \frac{96}{\sqrt{3}} \right)^2 \sqrt{3} \right]}{4} = \frac{3072\sqrt{3}}{4} = 768\sqrt{3} \text{ sq. units}$$

QUESTION ANALYTICS

### Q. 6

In a certain sequence, the term  $a_n$  is given by the formula  $a_n = k + \frac{n}{2}$ , where k is a constant. If the sum of all the terms from  $a_1$  to  $a_{20}$  inclusive equals 70, the value of k is

Have any Doubt?

A -1.75

Your answer is Correct

Solution:

(a)

Let's examine a few terms:

$$a_{1} = k + \frac{1}{2}$$

$$a_{2} = k + \frac{2}{2}$$

$$a_{3} = k + \frac{3}{2} \qquad \dots a_{20} = k + \frac{20}{2}$$
So, total sum =  $\left(k + \frac{1}{2}\right) + \left(k + \frac{2}{2}\right) + \left(k + \frac{3}{2}\right) + \dots + \left(k + \frac{20}{2}\right)$ 

$$= 20k + \frac{1}{2} + \frac{2}{2} + \frac{3}{2} + \dots + \frac{20}{2}$$

$$= 20k + \left(\frac{1}{2}\right)(1 + 2 + 3\dots + 20)$$

Sum of first n integers formula : 1 + 2 + 3 + 4 + ...  $n = \frac{n(n+1)}{2}$ 

Applying this formula to the sum 1 + 2 + 3 + ... + 20, we get

$$= 20k + \left(\frac{1}{2}\right) \left[ (20)\frac{21}{2} \right]$$

= 20k + 105

We're told that this sum equals 70, so ....

Solution:

(a)

$$f(x) = \lim_{x \to 0} \left[ \frac{2x^3 + 3x^2}{4x^3 - 5x^2} \right]$$

Since this has  $\frac{0}{0}$  form, limit can be found by repeated application of L'Hospitals rule.

$$f(x) = \lim_{x \to 0} \left[ \frac{6x^2 + 6x}{12x^2 - 10x} \right]$$
$$= \lim_{x \to 0} \left[ \frac{12x + 6}{24x - 10} \right] = \left[ \frac{12 \times 0 + 6}{24 \times 0 - 10} \right] = \frac{-6}{10}$$
$$= \frac{-3}{5}$$

 $x = a, b, c$ 

QUESTION ANALYTICS

#### Q. 10

Fifteen coupons are numbered from 1 to 15. Seven coupons are selected at random one at a time with replacement. What is the probability that the largest number appearing on a selected coupon is 9?

Have any Doubt?

 $\left(\frac{9}{16}\right)^7$ 

В

$$\left(\frac{8}{15}\right)^{\frac{1}{2}}$$

С

$$\frac{^{15}C_7}{(15)^7}$$

D

$$\left(\frac{3}{5}\right)^7$$

Your answer is Correct

### Solution:

(d)

Since there is replacement

Probability of selecting any coupon =  $\frac{1}{15}$ 

Probability of selecting coupon numbered less than number  $9 = \frac{9}{15}$ 

Probability of selecting 7 coupons

$$=\frac{9}{15} \times \frac{9}{15} \times ...7 \text{ times}$$

$$= \left(\frac{9}{15}\right)^7 = \left(\frac{3}{5}\right)^7$$

QUESTION ANALYTICS

# Q. 11

Fardeen can do a job in 6 days and Kanan can do the same job in 8 days. They both undertake the job for 7 1280. With the help of Meena, they finished it in 3 days. The money in rupees paid to Meena is \_\_\_\_\_\_

Have any Doubt?

160 (158 - 162)

Your answer is Correct160

Solution:

160 (158 - 162)

$$3 \times \left[ \frac{1}{6} + \frac{1}{8} + r_{meena} \right] = 1 \text{ unit of work}$$

Thus,

$$r_{\text{Meena}} = \frac{1}{3} - \left(\frac{1}{6} + \frac{1}{8}\right)$$

$$r_{\text{Meena}} = \frac{1}{24}$$

Thus, work done by Meena in 3 days:  $3 \times \frac{1}{24} = \frac{1}{8}$  units of work, and as the payment is dir proportional to the work done, the payment for her =  $\frac{1280}{8}$  = ₹ 160

**QUESTION ANALYTICS** 

#### Q. 12

The member of odd divisors of 3600 is \_\_\_\_

Have any Doubt?

9

**Correct Option** 

Solution:

The odd divisors are 1, 3, 5, 9, 15, 25, 45, 75 and 225.

Your Answer is 8

**QUESTION ANALYTICS** 

### Q. 13

The probability of getting a "tail" in a single toss of a biased coin is 0.2. The coin is tossed respectively till a "tail" is obtained. If the tosses are independent, then the probability of getting "tail" for the first time in the fourth toss is \_\_\_\_\_.

Have any Doubt?

0.1024 (0.0920 - 0.1126)

Your answer is Correct0.1024

Solution:

0.1024 (0.0920 - 0.1126)

$$P(T) = 0.2$$

$$P(H) = 0.8$$

Since all tosses are independent

So, probability of getting tail for the first time in 4th toss is

= P(H) P(H) P(H) P(T)

 $= 0.8 \times 0.8 \times 0.8 \times 0.2$ 

= 0.1024

**QUESTION ANALYTICS** 

### Q. 14

Newton-Raphson method is used to compute a root of the equation  $2x^2 + 5x - 9 = 0$  with 4.5 as the initial value. The approximation after one iteration is \_

# Ashima Garg

MY TEST

BOOKMARKS

MY PROFILE

BUY PACKAGE

ASK AN EXPERT

OFFER

EXCLUSIVE OFFER FOR OTS STUDENTS ONLY ON BOOK PACKAGES

#### Solution:

2.15 (1.95 - 2.35)

The equation is  $f(x) = 2x^2 + 5x - 9 = 0$ 

Newton-Raphson iteration equation is

$$x_1 = x_0 - \left[ \frac{f(x_0)}{f'(x_0)} \right]$$

$$f(x_0) = 2x_0^2 + 5x_0 - 9$$

$$f'(x_0) = 4x_0 + 5$$

$$x_1 = x_0 - \left[ \frac{2x_0^2 + 5x_0 - 9}{4x_0 + 5} \right]$$

$$= \frac{4x_0^2 + 5x_0 - 2x_0^2 - 5x_0 + 9}{4x_0 + 5}$$

$$= \frac{2x_0^2 + 9}{4x_0 + 5}$$

Put

$$x_0 = 4.5$$
 (as given)

$$x_1 = \frac{2 \times (4.5)^2 + 9}{4 \times (4.5) + 5} = 2.15$$

Your Answer is 0.94

QUESTION ANALYTICS

### Q. 15

Given the matrices 
$$A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 4 \\ 6 & 2 & 1 \end{bmatrix}$$
 and  $B = \begin{bmatrix} 2 \\ 4 \\ -2 \end{bmatrix}$ , the product  $B^TAB$  is \_\_\_\_\_\_.

Have any Doubt?

Your answer is Correct-20

### Solution:

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 4 \\ 6 & 2 & 1 \end{bmatrix} \text{ and } B = \begin{bmatrix} 2 \\ 4 \\ -2 \end{bmatrix}$$

$$B^{T}AB = \begin{bmatrix} 2 & 4 & -2 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 4 \\ 6 & 2 & 1 \end{bmatrix} \begin{bmatrix} 2 \\ 4 \\ -2 \end{bmatrix}$$

$$= \begin{bmatrix} -6 & 8 & 20 \end{bmatrix} \begin{bmatrix} 2 \\ 4 \\ -2 \end{bmatrix}$$

$$= -12 + 32 - 40 = -20$$

QUESTION ANALYTICS

### Q. 16

The volume V under the plane z = 2x + 5y and over the rectangle R :  $1 \le x \le 2$ ,  $0 \le y \le 3$  is \_\_\_\_\_.

Correct Option

#### Q. 19

Pipe A fills a tank of capacity 700 litres at the rate of 40 litres a minute. Another pipe B fills the same tank at the rate of 30 litres a minute. A pipe at the bottom of the tank drains the tank at the rate of 20 litres a minute. If pipe A is kept open for a minute and then closed and pipe B is open for a minute and then closed and then pipe C is open for a minute and then closed and the cycle is repeated, when will the tank be full?

Have any Doubt?

Α

42 minutes

Your answer is Wrong

В

14 minutes

C

39 minutes

D

40 minutes 20 seconds

**Correct Option** 

### Solution:

(d)

In three minutes net gain is 40 + 30 - 20 = 50 litres;

After 13 cycles (13  $\times$  3 = 39 minutes) net gain will be 13  $\times$  50 = 650 litres.

Then in 1 minute pipe A will add 40 litres, 10 litres to be filled;

Then to fill 10 litres pipe B will need  $\frac{10}{30} = \frac{1}{3}$  min

So total time  $39 + 1 + \frac{1}{3} = 40 \frac{1}{3}$  min

QUESTION ANALYTICS

Q. 26

Given that  $A = \begin{bmatrix} -10 & -3 \\ 4 & 0 \end{bmatrix}$  and  $I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$  the value of  $A^3$  is

Have any Doubt?

88A + 120I

Your answer is Correct

Solution:

(a)

$$A = \begin{bmatrix} -10 & -3 \\ 4 & 0 \end{bmatrix} \text{ and } I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Characteristic equation of A is

$$= \begin{vmatrix} -10 - \lambda & -3 \\ 4 & 0 - \lambda \end{vmatrix} = 0$$

$$(-10 - \lambda)(-\lambda) + 12 = 0$$

$$\lambda^2 + 10\lambda + 12 = 0$$

So, 
$$A^2 + 10A + 12I = 0$$

(by Cayley Hamilton theorem)

 $A^2 = -10A - 12I$ Multiplying by A on both sides, we have

$$A^3 = -10A^2 - 12A$$

$$A^3 = -10(-10A - 12I) - 12A$$

= 88A + 120I

В 88A + 110I

С

**Correct Option** 

Have any Doubt?

#### Solution:

1200 (1150 - 1250)

₹120 is simple interest for 2 years. ₹60 is 1 year SI. 126-120 = ₹6 is the interest on the first interest of ₹60.

That implies the rate of interest is 10%

for 10% the interest is 6 and principal is 60

for 100% the principal is 600

Therefore, the total investment is 2 × 600 = ₹1200

Your Answer is 600

**QUESTION ANALYTICS** 

#### Q. 28

There are 2 bars of gold-silver alloy. One bar has 2 parts of gold to 5 parts of silver. The other has 3 parts of gold to 5 parts of silver. If both bars are melted together to get a 20 kg bar with the final gold to silver ratio of 5:11, the weight of the first bar is \_\_\_\_\_ kg.

Have any Doubt?

14 (13.5 - 14.5)

**Correct Option** 

### Solution:

14 (13.5 - 14.5)

In the 20 kg bar,

Gold constitutes  $\frac{5}{16} \times 20 = \frac{25}{4}$  of the mixture

Silver constitutes  $\frac{11}{16} \times 20 = \frac{55}{4}$  of the mixture

Now,

Let G/S ratio in Bar 1 of the solution be 2a:5a

Let G/S ratio in Bar 2 of the solution be 3b:5b

Therefore,

2a + 3b = 25/4 and 5a + 5b = 55/4

Solving for the above you get,

b = 3/4 and a = 2

Now weight of the first bar =  $2a + 5a = 7 \times 2 = 14 \text{ kg}$ 

Your Answer is 14.545

QUESTION ANALYTICS

### Q. 29

A classroom has two analog (12-hour format) clocks, one on the east wall and one on the west wall. The clock on the east wall loses 25 seconds per hour, and the clock on the west wall gains 20 seconds per hour. If the clocks begin displaying the same time, they will next display the same time again in \_\_\_\_\_ days.

The clocks can show same time again only when their cumulative difference is 12 hours, since is gaining and the other is losing.

For every 1 hour, the relative difference is 45 seconds (25 +20)

If 45 seconds difference is created in 1 hour

Then 12 hours difference is created in  $\frac{(12 \times 3600)}{45}$  = 960 hours = 40 days

**QUESTION ANALYTICS** 

#### Q. 30

Let the random variable X follows binomial distribution with B(5, p) such that P(X = 2) = 2 P(X = 3), then the variance of X is \_\_\_\_\_\_. (Upto 3 decimal places)

Have any Doubt?

1.111 (1.01 -1.18)

Your answer is Correct1.111

#### Solution:

1.111 (1.01 -1.18)

X follows binomial distribution with n = 5 and p is unknown.

Given that 
$$\begin{split} P\left(X=2\right) &= 2P(X=3) \\ {}^{n}C_{2}p^{2}q^{n-2} &= 2\left({}^{n}C_{3}p^{3}q^{n-3}\right) \\ {}^{5}C_{2}p^{2}q^{3} &= 2\left({}^{5}C_{3}p^{3}q^{2}\right) \\ 10p^{2}q^{3} &= 2\left(10p^{3}q^{2}\right) \\ \Rightarrow & 10p^{2}q^{3} &= 20p^{3}q^{2} \end{split}$$

$$\Rightarrow \frac{p^2q^3}{p^3q^2} = 2$$

$$\Rightarrow \frac{q}{p} = 2, \qquad q = 2p$$

We know that p+q=1  $\Rightarrow p+2p=1$   $\Rightarrow 3p=1$   $\Rightarrow p=\frac{1}{3}$ 

$$\Rightarrow \qquad n = 5, \quad p = \frac{1}{3}$$

 $q = \frac{2}{3}$ Variance = npq  $= 5\left(\frac{1}{3}\right)\left(\frac{2}{3}\right) = \frac{10}{9} = 1.111$ 

QUESTION ANALYTICS

### Q. 31

The probability density function of a random variable  $\boldsymbol{x}$  is

$$f(x) = \frac{x}{3}(9 - x^2)$$
 for  $0 \le x \le 3 = 0$ 

The mean,  $\mu_x$  of the random variable is \_\_\_\_\_\_

Have any Doubt?

10.8 (10.5 - 11.3)

**Correct Option**

0, otherwise

$$\mu_x = \int_0^3 x f(x) dx$$

mean 
$$(\mu_x)$$
 =  $\int_0^3 x \frac{x}{3} (9 - x^2) dx = \int_0^3 \left( 3x^2 - \frac{x^4}{3} \right) dx$   
=  $\left[ x^3 - \frac{x^5}{15} \right]_0^3 = 27 - \frac{243}{15} = 10.8$ 

Your Answer is 3.6

**QUESTION ANALYTICS** 

#### Q. 32

A bag contains 30 tickets numbered 1, 2, 3, . . ., upto 30. Among them 5 are drawn at random and arranged in ascending order  $t_1 < t_2 < t_3 < t_4 < t_5$ . The probability of  $t_4$  being 25 (upto 2 decimal places) is \_ (Upto 3 decimal places)

Have any Doubt?

0.071 (0.070 - 0.080)

**Correct Option** 

#### Solution:

0.071 (0.070 - 0.080)

5 cards can be choosen from 30 cards in <sup>30</sup>C<sub>5</sub> ways.

∴ Total number of outcomes = <sup>30</sup>C<sub>5</sub>

Assume  $t_4$  is 25. There are 24 cards preceding 25.

 $t_{\rm 1},\ t_{\rm 2}\,{\rm and}\ t_{\rm 3}$  can be choosen from these 24 cards  $^{24}{\rm C_3}$  ways.

 $t_5$  should be greater than 25.

Number of such cards = 5

- Number of ways of choosing  $t_5 = {}^5C_1$
- Favourable outcomes =  ${}^{24}C_3 \times {}^5C_1$

$$\therefore \text{ Required probability} = \frac{{}^{24}C_3 \times {}^5C_1}{{}^{30}C_5} = \frac{(24 \times 23 \times 22 \times 5 \times 5!)}{(30 \times 29 \times 28 \times 27 \times 26 \times 6)} = \frac{7286400}{102604320} = 0.0710$$

Your Answer is 0.372

**QUESTION ANALYTICS** 

# Q. 33

If mean and standard deviation of a binomial distribution are 3 and  $\frac{3}{2}$  respectively, then binomial distribution

is  $(q+p)^n$ . The value of n is \_\_\_\_\_.

Have any Doubt?

12

Your answer is Correct12

Solution:

12

$$a_{max} = a_{max}^2 - \left(\frac{3}{3}\right)^2 - \frac{3}{3}$$
